Cautions for Using DYNACAP (Electric Double Layer Capacitor)

**Usage**

1. Electric double layer capacitors (DYNACAP) use a conductive organic electrolyte.
   
   The use at excessive mounting temperature or exceeding the upper category temperature can cause the electrolyte to leak. Especially, coin and multilayer coin types (DB, DBN, DX, DXJ, DX-L, DH, DK, DC, DCK, DS, and DSK series) excluding the DZ and DZN series use a low elastic plastic as the sealant in the cell construction like coin batteries; therefore, avoid using such capacitors in the vicinity of automotive equipment with steep temperature change, and heating element such as motor, relay, transformer, power IC, etc. because of the risk of leakage of electrolyte.

2. Since DYNACAP is polarized, do not apply a reversed voltage.
   
   DYNACAP is polarized. If a reversed voltage is applied for a long time, the leakage current will increase abruptly, which may cause a decrease in the capacity, an increase in the internal resistance, and causing leakage or damage to the product in some cases.

3. Do not apply any voltage higher than the operating maximum voltage (this means the surge voltage in the case of short-time charge).
   
   If an overvoltage is applied to the product, the leakage current will increase abruptly and the product will become overheated, which may cause a decrease in the capacity, an increase in the internal resistance, and causing leakage or damage to the product in some cases.

4. Do not use smoothing a power supply (for absorbing its ripple).

   Since the internal resistance of DYNACAP is high, the product will be overheated if it is used for smoothing a power supply (for absorbing its ripple), which may cause a decrease in the capacity, an increase in the internal resistance, and causing leakage or damage to the product in some cases.

5. Do not use in a circuit where quick charge and discharge are repeated very often.

   In a circuit where quick charge and discharge are repeated very often, the product will become overheated, which may cause a decrease in the capacity, an increase in the internal resistance, and causing leakage or damage to the product in some cases.

   Reduce the charge and discharge currents while selecting a product with low internal resistance, and make sure that the product surface temperature does not rise.

6. DYNACAP life depends heavily on the ambient temperature.

   ① The lifetime of DYNACAP is seriously affected by change in ambient temperature. If the temperature is lowered by 10°C, the lifetime will be approximately doubled. Therefore, the product should be used at a temperature lower than the guaranteed maximum value for maximum life.

   ② If the capacitor is used at a temperature exceeding its maximum guaranteed temperature, not only is its life shortened, but increased vapor pressure of electrolyte or electrochemical reactions may increase the internal pressure, and causing leakage or damage to the product in some cases.

7. Note that a voltage drop in DYNACAP occurs during backup.

   In a case where discharge current is large, or a large current flows instantaneously. an electric double layer capacitor (DYNACAP) may not operate at the start of discharge because of a large voltage drop (IR drop) caused by the product with the DC internal resistance.

   Please consult us for a large discharge current (in the case of other series except DZ series: when larger than 1 [mA] =1 x C[F]) as the internal resistance varies by each series. (Recommendation discharge current: 1 mA/F at 20°C)

8. Do not use the product in an ambient atmosphere containing waterdrops (condensation) or toxic gases.

   Although DYNACAP is sealed, water droplets or toxic gases may do degradation characteristics, a leakage and corrode the lead wires and the case, which may cause a breaking of the wires.

   Avoid abrupt temperature changes, which may cause water droplets, resulting in product deterioration and electrolyte leakage.

9. Contact us before connecting the products in series.

   A series connection will cause an imbalance in the voltage, charged to the capacitors and an overvoltage may be charged to one or more them. This may cause a decrease in the capacity, an increase in the internal resistance and causing leakage or damage to the product in some cases. When using series connection for several capacitors, please derate the applied voltage from the operating maximum voltage or use balancing circuits (bleeder resistor, etc.) to compensate for the imbalance in the applied voltage for each capacitor. Moreover, please ensure the arrangement does not cause temperature fluctuation between capacitors.

10. About vibration.

    A terminal blank, a terminal bend, and a crease may occur by adding too much vibration to a capacitor. Moreover, depending on the case, a DYNACAP may do degradation of the characteristic, breakage, and a leakage. When you become too much vibration, please contact our company.

11. When used on a double sided printed circuit board, do not overlap the wiring patterns on the mounted part.

    A short circuit may be created by certain wiring conditions. Should the electrolyte leaks, the circuit pattern may cause a short circuit, resulting in tracking or migration.

12. Do not keep in high temperature and high humidity atmospheres.

    ① Avoid high temperature or high humidity or direct rays when storing capacitors.

    ② Keep the product in a place where the temperature is 5°C~30°C and the humidity is lower.
3. Contact us when cleaning is necessary after soldering.
   Certain types of solvents are not compatible and may cause damage.
4. Contact us when the product is attached by adhesive bonding.
   Certain types of adhesives are not compatible. Paste bond partially between the product and the board so that the product will not adhere completely to the board. Do not raise the temperature over the guaranteed value while the bond is hardening.
5. Heating conditions of adhesive curing oven
   During heating of the adhesive curing oven, application of excessive heat may significantly shorten the product life or cause liquid leakage. Control the body temperature so as not to exceed 90°C during work while setting the allowable atmospheric temperature below 110°C, and allowable heating time within 30 seconds.
   For the heating conditions deviating from the above, consult with us providing your temperature profile conditions.
6. Be careful not to apply an excessive force to the capacitor body, terminals or lead wires.
   Mount the capacitor while making sure that the terminal spacing of the capacitor and the spacing of the holes in the printed wiring board are aligned.
   If the capacitor body is subjected to stress such as grabbing, falling, bending, pushing or twisting after mounted, its terminals may come off, leading to open, short or liquid leakage.

Other cautions
1. Emergency procedures
   If the DYNACAP overheats or starts to smell, immediately switch off the units main power supply to stop operation. Keep your face and hands away from the DYNACAP, since the temperature may be high enough to cause the DYNACAP to ignite and burn.
2. Periodical inspections should be established for the DYNACAP used in industrial appliances.
   The following items should be checked:
   ① Appearance : Check if there is leakage.
   ② Electronic performance : Check the leakage current, the electrostatic, the internal resistance and other items described in the catalog or the product specifications.
3. Disposing of DYNACAP.
   ① Punch a hole or crush the DYNACAP (to prevent explosion) before incineration at approved facility.
   ② If they are not to be incinerated, bring them to a professional industrial waste disposal company.
4. Other notes.
   Please refer to the following literature for anything not described in the product specifications or the catalog. (Technical Report of Japan Electronics and Information Technology Industries Association #EIAJ RCR-2370A “Guideline of notabilia for fixed electric double layer capacitors”)
